

## Installations

### Installation of Python

1. To download and install Python visit the official website of Python <https://www.python.org/downloads/> and choose your version.

2. Once the download is complete, run the exe for install Python. Now click on Install Now.
3. You can see Python installing at this point.
4. When it finishes, you can see a screen that says the Setup was successful. Now click on "Close".

### Installation of PyCharm

1. To download PyCharm visit website <https://www.jetbrains.com/pycharm/download/> and Click the "DOWNLOAD" link under the Community Section.

## Download PyCharm

Windows Mac Linux

### Professional

For both Scientific and Web Python development. With HTML, JS, and SQL support.

Download

Free trial

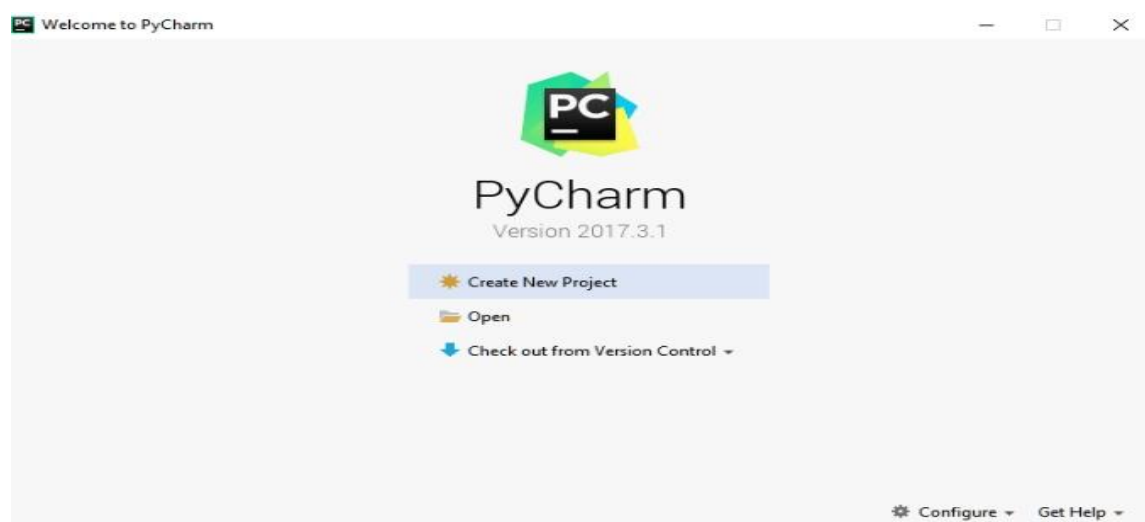

### Community

For pure Python development

Download

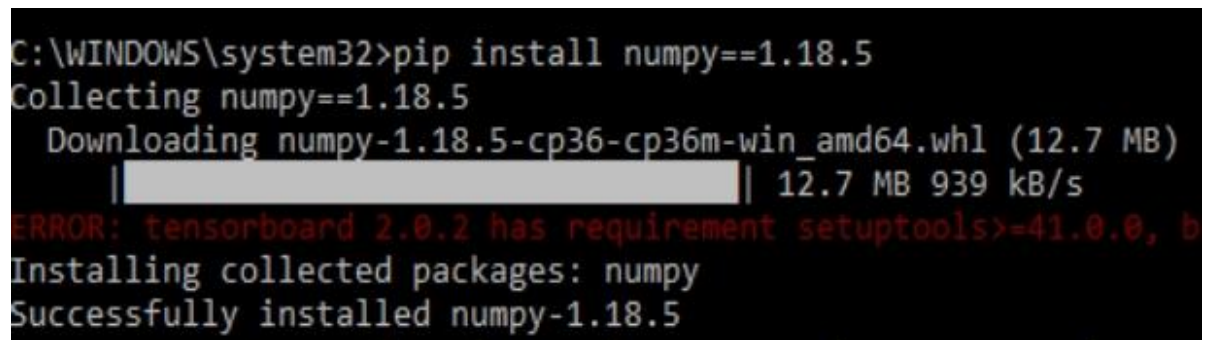

Free, open-source

2. Once the download is complete, run the exe for install PyCharm. The setup wizard should have started. Click “Next”.
3. On the next screen, Change the installation path if required. Click “Next”.
4. On the next screen, you can create a desktop shortcut if you want and click on “Next”.
5. Choose the start menu folder. Keep selected JetBrains and click on “Install”.
6. Wait for the installation to finish.
7. Once installation finished, you should receive a message screen that PyCharm is installed. If you want to go ahead and run it, click the “Run PyCharm Community Edition” box first and click “Finish”.
8. After you click on "Finish," the Following screen will appear.

9. You need to install some packages to execute your project in a proper way.
10. Open the command prompt/ anaconda prompt or terminal as administrator.
11. The prompt will get open, with specified path, type “pip install package name” which you want to install (like numpy, pandas, seaborn, scikit-learn, matplotlib.pyplot)

Ex: pip install numpy

```
C:\WINDOWS\system32>pip install numpy==1.18.5
Collecting numpy==1.18.5
  Downloading numpy-1.18.5-cp36-cp36m-win_amd64.whl (12.7 MB)
    |████████████████████████████████████████| 12.7 MB 939 kB/s
ERROR: tensorboard 2.0.2 has requirement setuptools>=41.0.0, but
Installing collected packages: numpy
Successfully installed numpy-1.18.5
```

## Installation of Xampp

### Step 1: Download

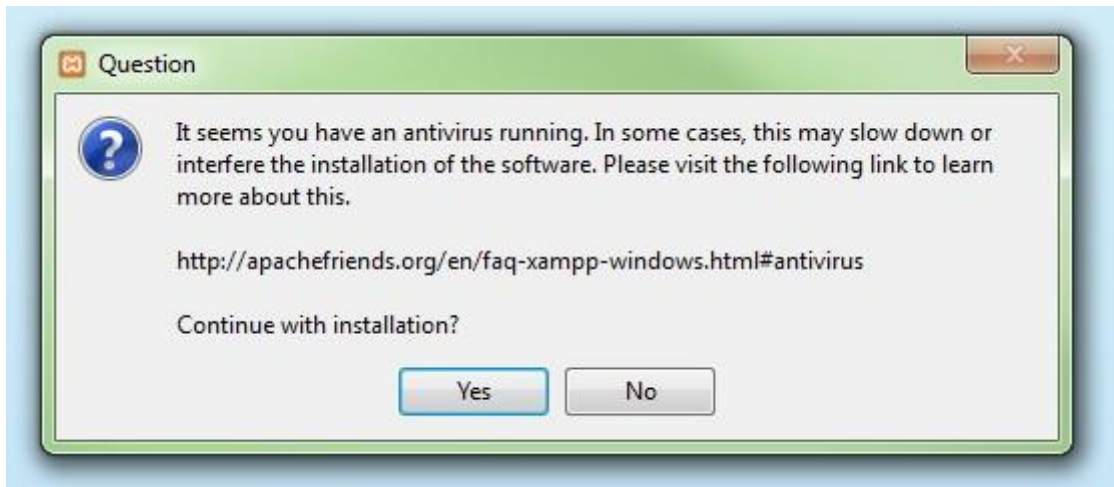

XAMPP is a release made available by the non-profit project Apache Friends. Versions with PHP 5.5, 5.6, or 7 are available for download on the [Apache Friends](#) website.

### Step 2: Run .exe file

Once the software bundle has been downloaded, you can start the installation by double clicking on the file with the ending [.exe](#).

### Step 3: Deactivate any antivirus software

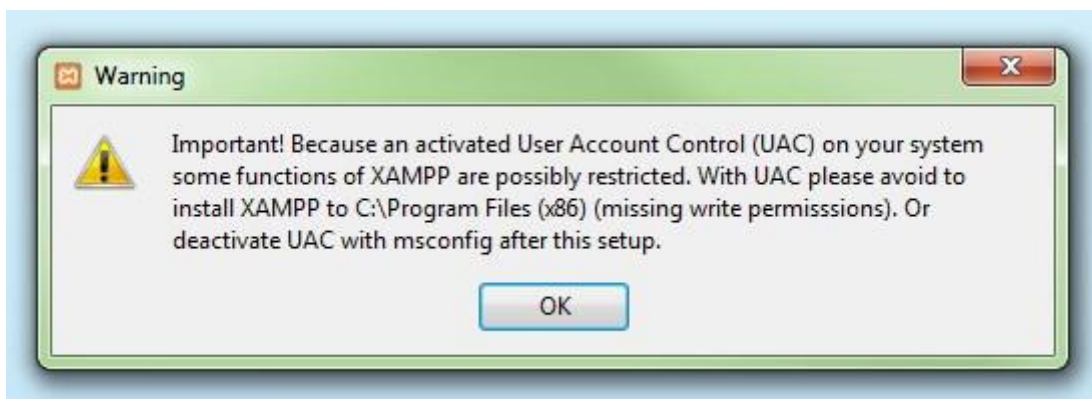

Since an active antivirus program can negatively affect the installation process, it's recommended to temporarily pause any antivirus software until all XAMPP components have successfully been installed.

Before installing XAMPP, it is advisable to disable the anti-virus program temporarily

#### **Step 4: Deactivate UAC**

User Account Control (UAC) can interfere with the XAMPP installation because it limits writing access to the C: drive, so we recommend you deactivate this too for the duration of the installation process. To find out how to turn off your UAC, head to the [Microsoft Windows support pages](https://support.microsoft.com/en-us/topic/windows-user-account-control-how-it-works-16957694-8848-476a-b1c1-17d41afcefb2).

Us

er account control can affect the installation of XAMPP

#### **Step 5: Start the setup wizard**

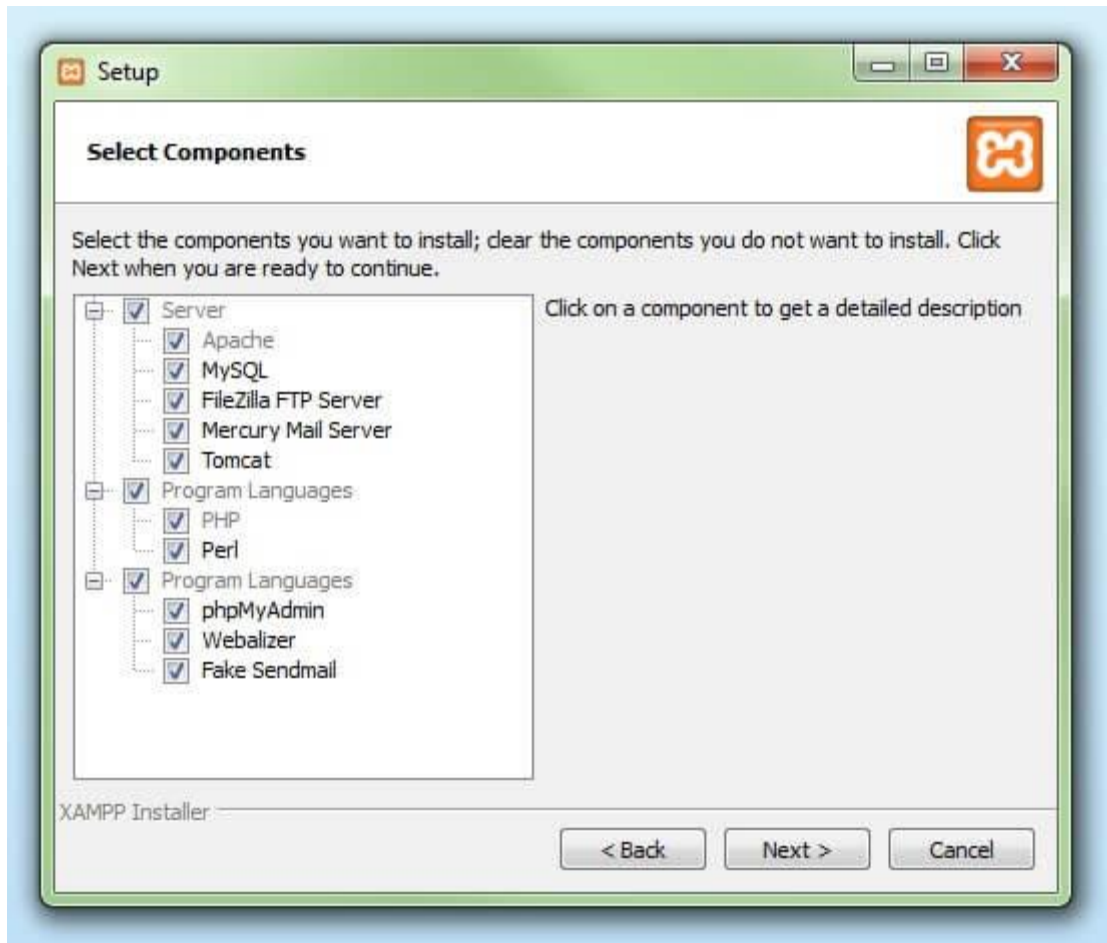

After you've opened the .exe file (after deactivating your antivirus program(s) and taken note of the User Account Control, the start screen of the XAMPP setup wizard should appear automatically. Click on 'Next' to configure the installation settings.

ou can start the setup on the startup screen

### Step 6: Choose software components

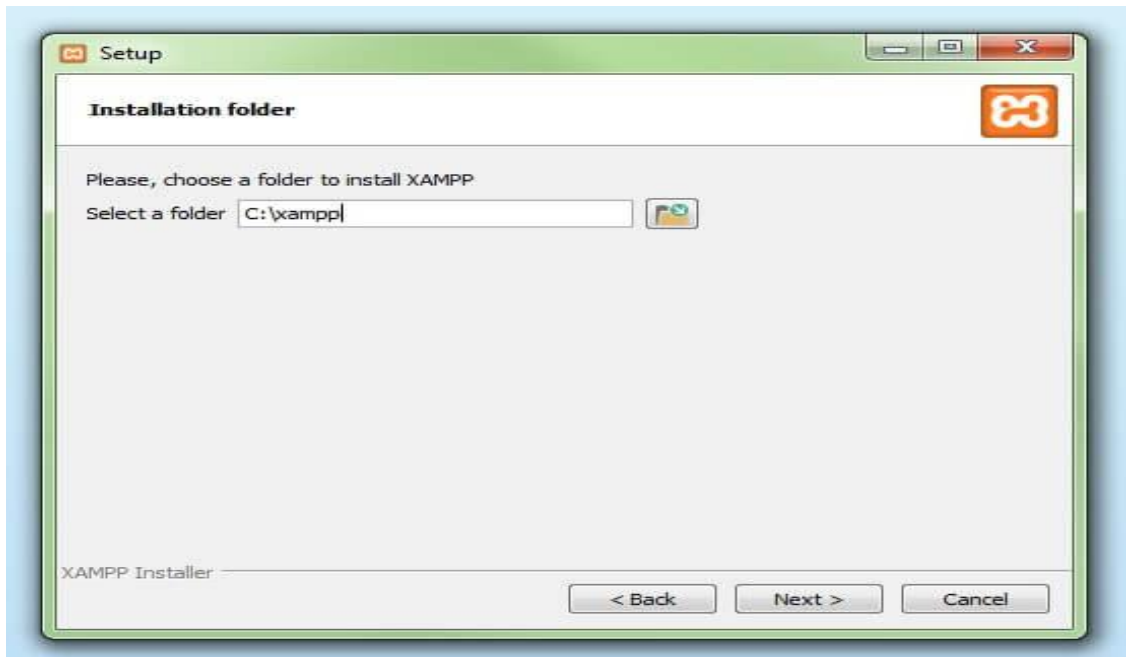

Under 'Select Components', you have the option to exclude individual components of the XAMPP software bundle from the installation. But for a full local test server, we recommend you install using the standard setup and all available components. After making your choice, click 'Next'.

In the dialog window entitled 'select components', you can choose the software components before installation

### Step 7: Choose the installation directory

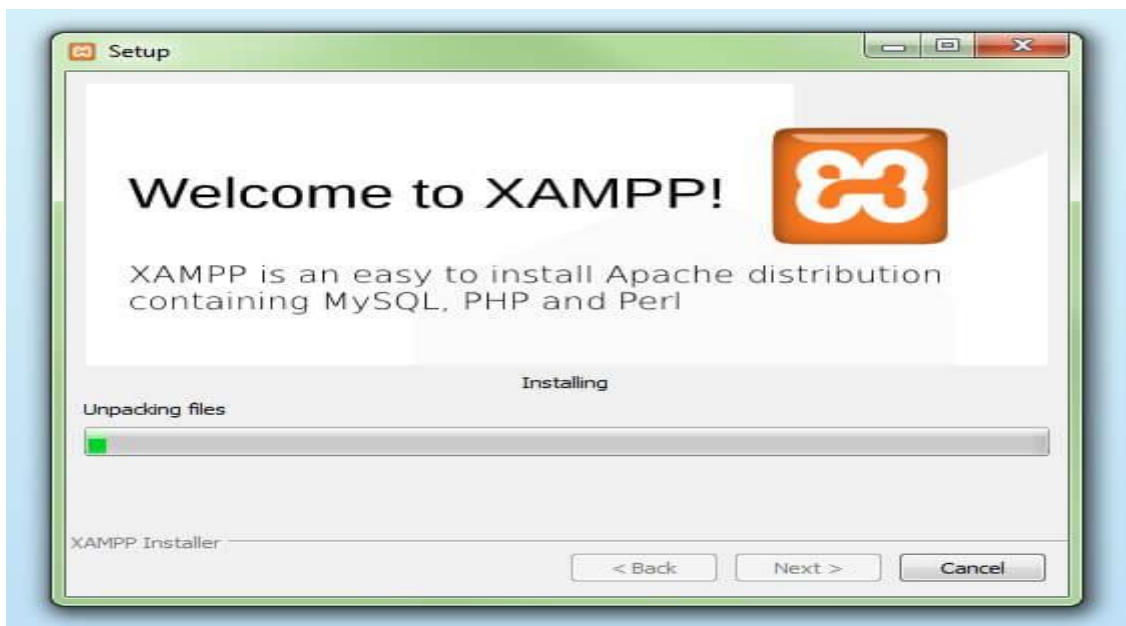

In this next step, you have the chance to choose where you'd like the XAMPP software packet to be installed. If you opt for the standard setup, then a folder with the name XAMPP will be created under C:\ for you. After you've chosen a location, click 'Next'.

For the next step, you need to select the directory where XAMPP should be installed

#### **Step 8: Start the installation process**

Once all the aforementioned preferences have been decided, click to start the installation. The setup wizard will unpack and install the selected components and save them to the designated directory. This process can take several minutes in total. You can follow the progress of this installation by keeping an eye on the green loading bar in the middle of the screen.

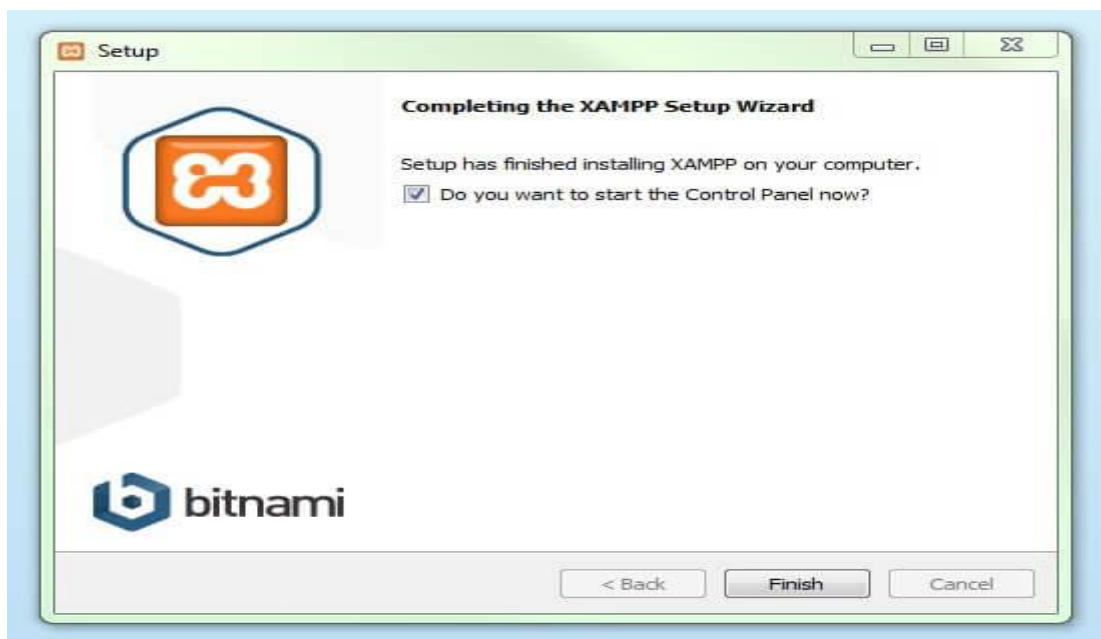

According to the default settings, the selected software components are unpacked and installed in the target folder

### **Step 9: Windows Firewall blocking**

Your Firewall may interrupt the installation process to block the some components of the XAMPP. Use the corresponding check box to enable communication between the Apache server and your private network or work network. Remember that making your XAMPP server available for public networks isn't recommended.

### **Step 10: Complete installation**

Once all the components are unpacked and installed, you can close the setup wizard by clicking on 'Finish'. Click to tick the corresponding check box and open the XAMPP Control Panel once the installation process is finished.

By clicking on 'finish', the XAMPP Setup Wizard is completed
